THEARTOF COMPUTER-GUIDED IMPLANTOLOGY

The static approach, better known as computer-guided surgery, refers to the use of a tissue-supported surgical template. This reproduces the virtual implant position directly from computerized tomographic data and this information can be converted to guide templates to be used during surgery, with or without raising a mucoperiosteal flap.

Current state of the art of computer-guided implant ...

The application of computer-guided implant dentistry in clinical practice and factors important to its successful implementation have been reported previously. 8 In the planning software, anatomic information from a CBCT scan is merged with prosthetic information that is derived from either a diagnostic wax-up on mounted study models (for the partially edentulous patient) or from an existing interim or final complete denture (for the completely edentulous patient). For a partially edentulous ...

Computer-Guided Implant Surgery | Inside Dentistry

However, computer-guided implant placement is not without limitations. It is a technique-sensitive procedure, involving the creation of studying models, di-agnostic wax-ups, and radiographic templates, CT scanning, interpretation of CT data, treatment planning, and the fabrication and stabilization of a surgical guide in the patient's mouth during surgery.

Implant Surgical Guides: State of the Art - Hammaslääkäri ...

Computer guided implantology with SurgiCase uses state of the art 3D technology, which guarantees precise dental implant treatment planning and placement - a significant additional value to implant treatment. The concept of the SurgiCase computer guided technology by the dentist at Woodbury Dental and Laser Clinic includes the use of SurgiCase software, as well as SurgiGuides.

Computer Guided Implantology - Woodbury Clinic

What is a Computer Guided Implant? A Computer Guided Implant uses 3/D Volumetric Tomography images, which are then fed into a dental simulation program. The procedure is painless, operation-free and quick (lasting about an hour), and does not require cutting into the gums and the necessity of remedial stitches.
