1. Natural Selection (makes alleles that make animals the strongest and less likely to die) 2. Sexual Selection (Certain individuals will be more attractive to others bc of specific traits; therefore not random mating) 3. Nonrandom Mating.

Biology - Evolution Study Guide Flashcards | Quizlet

Theory of Evolution. In his book *The Origin of Species*, Darwin presented evidence for his “descent with modification” theory, which has come down to us as the theory of evolution, although Darwin avoided the term “evolution.”. Essentially, Darwin suggested that random variations take place in living things and that the environment selects those individuals better able to survive and reproduce.

pressures, sources of variation, and random effects, such as genetic drift. Biological species concept: a species is a reproductively isolated population able to interbreed and produce fertile offspring.

AP Biology Notes: Evolution - Kaplan Test Prep

One piece of evidence offered by Darwin is found in the science of paleontology. Paleontology deals with locating, cataloging, and interpreting the life forms that existed in past millennia. It is the study of fossils—the bones, shells, teeth, and other remains of organisms, or evidence of ancient organisms, that have survived over eons of time. Paleontology supports the theory of evolution because it shows a descent of modern organisms from common ancestors.

Biology Evolution Study Guide | StudyHippo.com

While most of biology attempts to describe what the natural world is like, evolution explains how and why it became that way. The forces that drive changes in species are vital to an understanding of life itself. Evolution, it is often grinningly said, is an evolving science. Ideas about evolution have changed dramatically throughout history.
