many approximations and assumptions are made in the design of bolted and welded connection. Following are the requirements of a good connection in steelwork: 1) It should be rigid, to avoid fluctuating stresses which may cause fatigue failure. 2) It should be such that there is the least possible weakening of the parts to be joined.

MODULE 2, BOLTED AND WELDED CONNECTIONS

An existing bolted connection may have been designed and built to any of these criteria. Riveted joints are considered the snug-tight type. Adding Welds to Mechanically Fastened Joints. Welded connections are rigid. Welded connections are stiff.

Both bolted and welded rack meet the same Rack Manufacturers Institute (RMI) 2002 and AISI and AISC standards that govern steel design and construction. Limited bolt threads and nuts with serrated flanges secure bolts. Welded rack has lower installation costs. Welded vs. Bolted Rack Advantages

design and detailing are of primary importance for the economy of the structure. The type of connection designed has an influence on member design and so must be decided even prior to the design of the structural system and design of members. For example, in the design of bolted tension members, the net area is calculated assuming a

BOLTED CONNECTIONS - I

Bolted joints and welded joints Bolted joints are mainly used as temporary fasteners, which can be connected or disconnected whenever required. Mechanical engineering needs the components to be attached to each other temporarily or permanently for the functioning of the machine.

This design method allows us to determine a "Moment-rotation characteristic", which in turn allows us to represent the real connection by a rotational spring connection defined in the centre lines of column and connected beam in the point of their intersection (approximation to the real behaviour of the connection).
