An electronic health record (EHR) is a digital version of a patient's paper chart. EHRs are real-time, patient-centered records that make information available instantly and securely to authorized users. While an EHR does contain the medical and treatment histories of patients, an EHR system is built to go beyond standard clinical data collected in a provider's office and can be inclusive of a broader view of a patient's care.

What is an electronic health record (EHR)? | HealthIT.gov

Let's review health information system trends, decade by decade. I'll list the main influence driving healthcare, the driver for IT, and the resulting health information technology (HIT) innovation: 1960s: The main healthcare drivers in this era were Medicare and Medicaid. The IT drivers were expensive mainframes and storage.

Healthcare Information Systems: Past, Present, Future

eHealth (also written e-health) is a relatively recent healthcare practice supported by electronic processes and communication, dating back to at least 1999. Usage of the term varies as it just not covers the "Internet medicine" as it was conceived during that time, but also covers "virtually everything related to computers and medicine".

eHealth - Wikipedia
