4 Fundamentals of polymer chemistry Addition polymerisation of a different type takes place through the opening of a ring, especially the epoxide ring in ethylene oxide $\text{CH}_2\text{CH}_2\text{O}$ This opens as $-\text{CH}_2\text{CH}_2\text{O}-$; ethylene oxide thus acts as a bifunctional monomer forming a polymer as $\text{H}(\text{CH}_2\text{CH}_2\text{O})_n\text{CH}_2\text{CH}_2\text{OH}$, in this case a terminal water molecule being added.

In general, a lot of polymers are manufactured, processed, or used as solution. For many years, polymer solutions have been considered colloidal systems. The reason for this is the similarity between the macromolecule sizes in polymer solutions and the sizes of the dispersed particles in the low molecular weight dispersed colloidal systems.
