Inflammation is part of the body's defense mechanism and plays a role in the healing process. When the body detects an intruder, it launches a biological response to try to remove it. The attacker...

Inflammation: Types, symptoms, causes, and treatment

The molecular mechanism of inflammation is quite a complicated process which is initiated by the recognition of specific molecular patterns associated with either infection or tissue injury. The...

Therefore, modulation of cardiac inflammation has been suggested as an attractive target for the treatment of heart failure, which has been investigated in numerous clinical trials. This review discusses key inflammatory mechanisms contributing to the pathogenesis of heart failure and their potential impact as therapeutic targets.

Key Inflammatory Mechanisms Underlying Heart Failure

When you have chronic inflammation, your body's inflammatory response can eventually start damaging healthy cells, tissues, and organs. Over time, this can lead to DNA damage, tissue death, and...

Mechanisms of neutrophil rolling, adherence, diapedesis and chemotaxis. Inflammation causes neutrophil margination followed by development of loose interactions between endothelial cells and neutrophils. These interactions are mediated by selectins and their ligands, which facilitates neutrophil rolling.

When inflammation happens, chemicals from your body's white blood cells enter your blood or tissues to protect your body from invaders. This raises the blood flow to the area of injury or...

Inflammation: Definition, Diseases, Types, and Treatment

Inflammation presents the latest international advances in experimental and clinical research on the physiology, biochemistry, cell biology, and pharmacology of inflammation. Published items include full-length scientific reports, short definitive articles, and papers from meetings and symposia proceedings.

The role of inflammation in heart attack and stroke "Exactly how inflammation plays a role in heart attack and stroke remains a topic of ongoing research," added Deepak Bhatt, M.D. "It appears that the inciting event in many heart attacks and some forms of stroke is buildup of fatty, cholesterol-rich plaque in blood vessels."

Inflammation is a generic response, and therefore it is considered as a mechanism of innate immunity, as compared to adaptive immunity, which is specific for each pathogen. Too little inflammation could lead to progressive tissue destruction by the harmful stimulus (e.g. bacteria) and compromise the survival of the organism.

effects, such as immune suppression. Uncontrolled inflammation is now considered pathophysiologic and is associated with many widely occurring diseases such as cardiovascular disease, neurodegenerative diseases, diabetes, obesity, and asthma, as well as classic inflammatory diseases (e.g., arthritis and periodontal

Abstract. A chronic inflammatory disease is a condition characterized by persistent inflammation. A number of human pathologies fall into this category, and a great deal of research has been conducted to learn more about their characteristics and underlying mechanisms. In many cases, a genetic component has been identified, but also external factors like food, smoke, or environmental pollutants can significantly contribute to worsen their symptoms.

Inflammation is one mechanism that may help to explain this link. Chronically high levels of inflammation predict disease. Across the lifespan, people who have supportive close relationships have lower levels of systemic inflammation compared to people who have cold, unsupportive, conflict-ridden relationships.

Inflammation can cause various chronic diseases like inflammatory bowel diseases. Various food protein-derived bioactive peptides (BAPs) with anti-inflammatory activity have the potential to manage these diseases. The aim of this paper is to overview the mechanisms and the molecular targets of BAPs to exert anti-inflammatory activity.

Cotrimoxazole curbs inflammation. Prophylactic antibiotics are used in HIV-endemic areas and have been shown to reduce mortality and morbidity. Using samples from a clinical trial where HIV-positive children were randomized to continue or stop cotrimoxazole, Bourke et al. examined potential mechanisms behind these protective effects. They observed decreases of certain types of Streptococcus in ...

Cotrimoxazole reduces systemic inflammation in HIV ...

Inflammation is associated with the release of soluble mediators that drive cellular activation and migration of inflammatory leukocytes to the site of injury, together with endothelial expression of adhesion molecules, and increased vascular permeability. It is a stepwise tightly regulated process that has been evolved to cope with a wide range of different inflammatory stimuli.
