In this article, we'll use Scilab to decode an FSK signal, but the computations involved are not complicated and could easily be implemented as C code in a digital signal processor. First Things First: The Math. Our technique for decoding FSK is based on the multiplication of sinusoidal signals. Consider the following trigonometric identities:

The creation of synthetic signals can be accomplished using the Scilab function `randwhich` generates random numbers. The user can generate a sequence of random numbers, a random matrix with the uniform or the gaussian probability laws. A seed is possible to re-create the same pseudo-random sequences.
