Rattlesnake example - two-way anova without replication, repeated measures. This example could be interpreted as a two-way anova without replication or as a one-way repeated measures experiment. Below it is analyzed as a two-way fixed effects model using the lm function, and as a mixed effects model using the nlme package and lme4 packages.

R Companion: Two-way Anova
To perform a two-way ANOVA in Minitab, use Stat > ANOVA > General Linear Model > Fit General Linear Model. Suppose your response is called A and your factors are B and C. Choose Stat > ANOVA > General Linear Model > Fit General Linear Model. In Responses, enter A. In Factors, enter B C. Click Model. In Factors and covariates, select both B and C.

ANOVA. To test the significance of this effect, we will need to use a mixed-design ANOVA. That is where Pingouin comes into play. We are going to use the mixed_anova function with the following input arguments: dv: name of the column containing the dependant variables; within: name of the column containing the within-group factor; between: name of the column containing the between-group factor.

Fahimeh Hassani you should use two way mixed ANOVA model since you have one within-subjects factor and one between-subjects factor. Cite. 11th May, 2020. Katrina Steele. University of Salford.

Two-Way ANOVA or Mixed ANOVA? - ResearchGate
A two-way ANOVA is, like a one-way ANOVA, a hypothesis-based test. However, in the two-way ANOVA each sample is defined in two ways, and resultingly put into two categorical groups. Thinking again of our walruses, researchers might use a two-way ANOVA if their question is: "Are walruses heavier in early or late mating season and does that ...

Use a two-way ANOVA when you want to know how two independent variables, in combination, affect a dependent variable. Example. You are researching which type of fertilizer and planting density produces the greatest crop yield in a field experiment.

Two-way ANOVA | When and How to Use it, With Examples
If one factor is repeated measures and the other is not, this analysis is also called mixed model ANOVA. Choose carefully, as the results can be very misleading if you make a choice that doesn't correspond to the experimental design. The choices are: No matching. Use regular two-way ANOVA (not repeated measures).
